9/26/2018

## Pipeline Compliance Surveillance Initiative (CSI)

The CSI is a program of the Allegheny-Blue Ridge Alliance (ABRA) and its member groups.

### CSI Volunteer Options

#### Citizen Observers

A volunteer position that anyone can do, Citizen Observers work independently or with ABRA member organizations to observe and report incidents of both downstream surface water impact and noncompliance with construction requirements. Whether you're a concerned landowner, neighbor, community member, or just a passer-by, keeping a watchful eye for water pollution and unlawful construction practices is something any sighted person can do and the easiest way to participate in the CSI program.

#### Stream Monitoring Program Volunteers

For folks interested in protecting the health of our state waters and aquatic life, participating in monitoring programs managed by local watershed groups and regional programs such as the Trout Unlimited/West Virginia Rivers Pipeline Monitoring program or the Isaak Walton

# Pipeline CSI

## Compliance Surveillance Initiative

# Local Coordinator Playbook

*Local Coordinators are integral to the success of the Pipeline Construction Surveillance Initiative (CSI.) They organize the actions of on-the-ground volunteers and coordinate with landowners to observe and record unlawful pipeline construction activity in their areas. Local Coordinators help build incident reports of non-compliant construction activity and of construction-related pollution incidents that are then submitted to both state and federal regulatory agencies. Not waiting on our government to do the right thing, the Pipeline CSI also uses that community-supplied data to build bodies of evidence for the many court cases against the permits that underly government approval of ACP. All of this starts with you and your local community of committed volunteers*

League Save Our Streams program are sure ways to protect our region from harm in a community-driven way. Water monitoring volunteers can take part in trainings conducted by the above programs and follow the established protocols and reporting methods so that their reporting can be used as trusted scientific data.

## CSI First Responders

First Responders are teams dispatched by CSI Central to investigate, verify, and document reported incidents of surface water impacts or noncompliance with pipeline construction requirements. First Responders are recruited based on professional or scientific background related to water resources or erosion and sediment control and stormwater management, or other relevant technical experience to collect data and investigate reported incidents following Pipeline CSI protocols.

## Pipeline Air Force

Volunteer pilots and drone operators are recruited and trained to fly routine pipeline surveillance flights and incident response flights. Videos and photos from the air give us a new angle to watch for violations. Many sections of the ACP cross remote, forested mountain terrain that is *only* viewable from above, making our Pipeline Air Force volunteers indispensable to our evidence-gathering activities.

# Volunteers

**Volunteers** are the lifeblood of the CSI. Each of the volunteer types (listed on the left-hand sidebar) has an important role in ensuring that the Atlantic Coast Pipeline construction and operation cause as little environmental degradation as is possible and that ACP and our state and federal regulators are held accountable for their egregious shortcomings. For volunteer coordinators, we're most concerned with the organization and deployment of Citizen Observers, First Responders, and Water Monitors). In the following few pages, we'll review their roles and activities and how they interface with CSI.

## Volunteer Recruitment

**Volunteer Recruitment** is done via local organizations along the pipeline route as well as through broad outreach by the Allegheny-Blue Ridge Alliance's (ABRA) CSI-specific organizers. CSI has hosted wide ranging meetings and local events with coordinators and has a web-based sign up at <http://pipelineupdate.org/csi-volunteer/>. ABRA hosts local meetings for members and citizens to enlist local participants.

## Training Volunteers

Like recruiting, **Volunteer Training** is a combination of local and coordinated ABRA/CSI instruction. Locally, coordinators can assess skills and determine training needs. CSI, in partnership with Trout Unlimited (TU) and the Sierra Club (SC) have a program that covers construction basics, watershed crossings, CSI programming and landowner outreach. Trainings on the use of drones and other specialized equipment are ongoing and available upon request.

## Deploying Volunteers

**Volunteer Deployment** is done at the local coordinator level. That individual will be notified of a potential incident that has been reported via one of the CSI citizen reporting options at <http://pipelineupdate.org/csi-reporting/>; that is, phone, email, or online form. In some cases a coordinator may be apprised directly about an incident from one of the volunteers. When this happens, it is important for the coordinator to start an incident report in the CSI system.

## CSI Incident Review

Incident Review volunteers pour over the data and information gathered on the online [CSI Mapping System](#) by other volunteers to evaluate incidents of surface water impacts or noncompliant construction. Input to the CSI Environmental. This volunteer Incident Review assistance is requested from professionals with erosion and sediment control and stormwater management backgrounds, as well as from other knowledgeable individuals. This can be done from anywhere with access to Training will be scheduled for interested participants, and information concerning regulatory and technical requirements will be provided through the Pipeline CSI website.

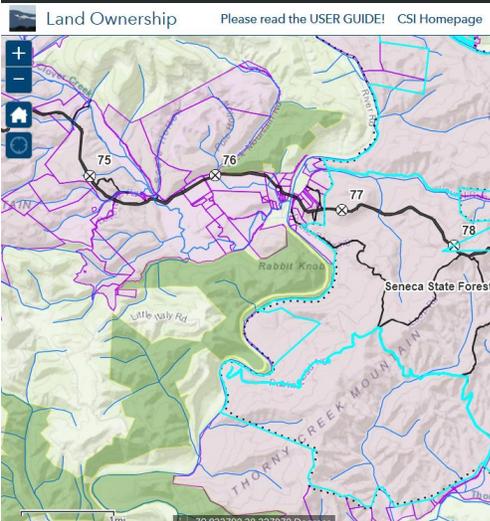

# Landowners

## Recruiting & Enrolling Landowners

Landowner participation is critical to the success of our monitoring efforts. We recommend taking great care when recruiting, because landowners are important 1) for access to pipeline sites on private property; 2) as eyes and ears on the construction itself, and 3) for providing the best access to neighboring landowners and property. Here are some steps to successfully recruit landowners.

1. Determine land ownership. Individual property tax parcel numbers crossed by the pipeline right of way (ROW), near the pipeline ROW and crossed by access roads are available on the CSI mapping system. Additional information for each parcel includes waterbody crossings, slope steepness, and proximity to other features such as native trout streams, karst and sinkholes. The individual parcels can be cross-referenced with county assessment data to determine ownership. Examples of these online sites include:
  - a. Nelson County, VA – <http://www.nelsoncounty-va.gov/government/geographic-information-systems/>
  - b. Augusta County, VA - <https://www.co.augusta.va.us/government/circuit-court-clerk/online-access-to-land-records>
  - c. Buckingham County, VA - <http://buckingham.interactivegis.com/>
  - d. Randolph County, WV <https://www.acrevalue.com/plat-map/WV/Randolph/>
  - e. Upshur County, WV <https://www.acrevalue.com/plat-map/WV/Upshur/>
  - f. Pocahontas County WV <https://pocahontascountyassessor.com/maps/>
  
2. Develop a plan to reach out to each landowner. Most of these meetings will be face to face. So, in advance, answer as many of these as you can: Who in their circle of friends are sympathetic? How about their neighbors? Who is the best candidate(s) to approach them? What might be the highest value for participating for this targeted landowner? Second highest? Other considerations?
  
3. Execute the landowner plan. Meet with each landowner and present the CSI story. They may have granted or even welcomed an easement, but reinforce that it is still their land, and the best way to ensure that it retains its value is to monitor it during construction. Pictures of some sites along the MVP or ACP where

## CSI Mapping System

Use the Pipeline CSI Mapping System to find monitoring locations, property line boundaries, and links to county GIS tax records to learn land ownership!

### Quick Guide

September 17, 2018

#### Introduction

The Pipeline Compliance Surveillance Initiative Mapping System is an online interactive map, also called a geographic information system (GIS), designed to provide high-quality geographic data regarding the proposed disjunctive Atlantic Coast Pipeline (ACP).

The purpose of the CSI Mapping System is to support public oversight and data-based resistance to the construction of the ACP, which will harm our region's resources and endanger our collective future if allowed to be built. The geographic extent of the mapping system includes the 700 miles of upland areas, extending from Harrison Co, WV to Buckingham Co, VA.

The CSI Mapping System is an ongoing effort by the Allegheny Blue Ridge Alliance and our coalition members. We are always looking for volunteers & support.

## Pipeline CSI Online Mapping System

### A Powerful Pipeline Fighting Tool

Use this guide as you navigate our coalition's new and improved online Mapping System. Learn how close the ACP is proposed to be to your home, water source, creek, or favorite viewpoint. View the geologic and downstream risks associated with this route. Let this mapping system guide your geographically-based organizing and environmental monitoring efforts. We are always improving and adding to our data, so stay tuned to our Pipeline Air Force Flight's Tab especially to stay informed on the so-called "progress" of the Atlantic Coast Pipeline.

Volunteers collaborating.

work is being done can help drive home this point. Secure the landowner release (copy attached.), and make sure that you/we understand any unique conditions for that landowner. For example, do they want us to use a specific gate for access, limit visits to within construction periods only, not arrive after dark, call first, etc. Finally, if you know which volunteer or volunteers are going to monitor this landowner's site, arrange to introduce them. And, make sure that the landowner knows how to reach CSI.

4. If this landowner is responsive, is he or she willing to introduce us to neighbors? A referral from a neighbor can be our best means of securing the next one.

---

**Joyce Burton, Landowner Liaison and CSI Local Coordinator for Friends of Nelson shares this tip from her experience getting to know landowners and neighbors along the route of the ACP:**

*“Depending on how many contacts a coordinator may already have in a particular area, it may be more efficient time-wise to identify a single landowner in a particular neighborhood and to “sell” the CSI to them first, and then recruit them to help organize a “neighborhood” meeting to introduce the CSI concepts to a larger group of folks in a particular area. This “neighborhood” meeting could happen at a person’s house, at a church, etc. That larger meeting should NOT be limited to impacted landowners, as other neighbors may be useful eyes and ears, as well as useful in connecting the Coordinator to other landowners who may not already be “plugged in”. From there, the Coordinator can build their contact list, schedule one-on-one meetings to learn about the ins and outs of specific landowner parcels or possibly plan additional “neighborhood” meetings for trainings or further outreach in other neighborhoods.*”

---

## Violation Reporting Resources

Use our reporting resources below to sound the alarm when you spot construction violations. Use the Mapping System to plan your monitoring or other activism or describe the violation location.

### Hotline

## Monitoring Construction Activity

For training on conducting pipeline visual assessments, see WV Rivers and TU's webinar recording: <http://wvrivers.org/our-programs/water-monitoring/pipelinevisualassessment/>

### Pipeline Construction Process

The sections below describe different phases of pipeline construction activity. We list them here so you can be knowledgeable about the process and consequently make your reports and actions more effective and better informed. Please review these descriptions so you know what compliance and noncompliance look really mean.

**Clearing and Grading** – Cutting, removal and burning of trees, brush and debris from the pipeline right of way (ROW.) Timber may be salvaged or chipped, mulched or burned. Grubbing or stump removal and grading are included. These may involve blasting and/or heavy equipment usage.

- Key monitor actions include making sure that Erosion and Sediment Control (ESC) measures are in place and functioning correctly, and that ROW does not exceed limits of disturbance.

**Stockpiling and Stringing** – Transportation of pipe and equipment to designated yards and delivered to the ROW.

- Actions here include ensuring that ESC measures are not compromised.

**Field Bending** – also called cold bending occurs to ensure that the pipe fits the trench and ROW.

- Again, ESC measures must be in place and functioning as designed.

**Ditching and Excavation** – usually occur after the pipe is coated, welded and put in place. This involves excavating for the pipeline trench and is required for entry and exit in trenchless crossings.

- ESC measures must not be compromised. Trench lengths must be kept to 500 feet or variance maximum and trench breakers must be installed and maintained.

**Welding** – or joining the sections of pipe together is done in the ROW.

- No compromise to any of the above measures is allowed.

**Coating** – provides a protective barrier for the pipe sections and is done at manufacture. Additional coating is required in the field at weld areas.

- No spills or contamination is allowed.

**Lowering In** – refers to the preparation of the trench base and picking up and placing the pipe in the trench.

- ESC measures and trench breakers must be maintained.

**Backfilling** – refers to refilling the trench once the pipe is in place. Subsoil goes in first, then topsoil.

- ESC measures in place per plans.

**Cathodic Protection** – is used to protect the pipe from corrosion.

**Hydrostatic Testing** – is pressure testing to ensure pipeline will not leak during operation. Water is used as the medium.

**Clean Up and Restoration** – is the final cleaning and removal of all non-native materials from the ROW.

## Top Observable Incident Types

- 1) **Failure to install, or delayed installation of, erosion and sediment control (ESC) measures as required by approved plans or by regulations.**
- 2) **Lack of maintenance of installed ESC measures as required by regulations.**
- 3) **Failed, damaged, missing, or improperly installed silt fences, filter socks or other perimeter control devices.**
- 4) **Failed, damaged, or improperly constructed or spaced right-of-way diversions (water interceptor diversions, water bars, slope breakers).**
- 5) **Failed or improperly constructed outlet structures at ends of right-of-way diversions.**
- 6) **Formation of downslope gullies within or at the perimeter of the construction right-of-way.**
- 7) **Sediment discharge into streams and wetlands during in-stream or wetland trenching operations and discharge of sediment from failed or by-passed dewatering structures.**
- 8) **Failure to construct and properly maintain construction entrances at public roads.**
- 9) **Failure to stabilize construction areas, bare ground, and stockpiles of spoil or topsoil, after active disturbance.**
- 10) **Failure to contain petrochemicals.**
